

Smart Healthcare App Summary

One-page repo-based overview generated from source files in this workspace. Items called out as Not found in repo were not evidenced in the code inspected.

What it is

Smart Healthcare is a Next.js web app that bundles symptom triage, virtual doctor chat, appointments, pharmacy browsing, and facility discovery into one patient-facing experience. The repo shows a mix of production-backed flows and polished demo screens.

Who it's for

Primary persona: patients or everyday consumers who want quick health guidance, simple booking, medicine ordering, and an easy dashboard for routine healthcare tasks.

What it does

- Streams AI symptom analysis from **/api/symptom-check** into the landing page and the dedicated symptom checker.
- Lets users sign up, log in, stay signed in with a cookie session, and access protected **/app** routes.
- Provides a virtual doctor chat UI that streams responses from **/api/chat**.
- Creates and lists appointments through MongoDB-backed API routes.
- Shows nearby clinics, hospitals, and pharmacies on an interactive Leaflet map with client-side filters.
- Supports pharmacy browse/cart flows and mock checkout in the UI.
- Displays profile/order/dashboard views; order history is currently mock data in the page component.

How it works

- Frontend: Next.js 16 App Router pages under **app/**, with client-heavy React screens, Framer Motion, and shared UI components.
- Routing/data flow: browser pages call route handlers in **app/api/***; responses stream directly back to the UI for chat and symptom analysis.
- Auth: **lib/auth.ts** hashes passwords with bcrypt, stores users/sessions in MongoDB, sets a **sessionToken** cookie, and middleware redirects unauthenticated users from **/app/*** to login.
- AI services: symptom checks use Google Generative AI via Gemini 2.5 Flash; doctor chat uses Groq Mixtral through the AI SDK.
- Persistence: MongoDB is used for **users**, **sessions**, **appointments**, **consultations**, and a **medicines** collection endpoint.
- Repo gaps: seeded facility data, seeded order data, and a production order-fulfillment backend are **Not found in repo**.

How to run

- Install deps: **npm install**.
- Create local env from **.env.example** and set **MONGODB_URI**, **MONGODB_DB**, and **GOOGLE_GENERATIVE_AI_API_KEY**.
- Start MongoDB locally or point the app at a reachable MongoDB instance.
- Run **npm run dev** and open the local Next.js URL shown in the terminal.
- Seed scripts, test fixtures, and a documented sample dataset are **Not found in repo**.

Evidence base: app/page.tsx, app/app/*.*tsx, app/api/*, middleware.ts, lib/auth.ts, lib/mongodb.ts, .env.example, package.json.
